The invention also relates to control systems or computer-based systems that are to be used in such or similar devices or assemblies, such as to control or to influence any external factors or to control or to influence the evolution of any state or value. The invention further relates to semiconductor devices and to computer chips such as microprocessors, microcontrollers, flash memories or any other form of electronic equipment or computers which operate under software control and may be used in such devices or assemblies. A good description of MEMS (micro electromechanical systems) can be found in U.S. Pat. No. 6,613,255 B1 (Keller), in particular at the beginning of paragraph 19. A typical use of MEMS is for measurement. One example is a MEMS oscillator, such as a MEMS resonator, and a MEMS oscillator bridge circuit. One example of a MEMS oscillator is an LC oscillator circuit that has a MEMS resonator. Another example is a MEMS resonant circuit. The oscillation frequency can be set by means of an external tuning variable such as an RF signal or a signal in an oscillator driver circuit, such as a piezo-electric control signal. The sensitivity of the resonant frequency to the tuning variable is given by the Q of

the resonator. The Q is given by the ratio between the resonance frequency of the resonator and the half-power width of the resonance frequency. As another example of a measurement with a MEMS oscillator is the use of a MEMS system for measuring the temperature. In this case, the measurement signal is the oscillator amplitude of the MEMS resonator or the frequency oscillator. The oscillator amplitude can vary with the ambient temperature. Thus, the temperature of an object can be deduced from the
